

# *The 'DAISY' Combi* Whole Home Ventilation System

*For applications in dwellings where no roof space is available*

## TAKE CONTROL OF CONDENSATION

Windows dripping Condensation, Water pooling on sills, Dampness, Black Mould Growth on walls and ceilings, Mildew on clothing, Musty smells etc... Welcome to a typical U.K. home in winter. The COMBI discreetly banishes condensation from homes. The unit gently introduces clean, fresh filtered air into the home, thereby improving indoor air quality. This cleaner fresher air replaces moist damp air, created by everyday living.

The unit is normally mounted on the inside of an outer wall, in a kitchen or an enclosed porch and ducted to the hallway using white 4" x 2" rigid pvc ducting, (not supplied) and terminating with a 6" louvre at ceiling level in the hallway where warm air naturally accumulates, tempering it and redistributing it around the home.

**Specification:** Power 220 -240 vac 50 Hz. Max current 1.0 amp.  
Weight 8 kgs. Size 20" x12" x 6" (500mm x 300mm x 150mm).

- **Whisper quiet in operation.**
- **Low Maintenance.**
- **User friendly, no water containers to empty.**
- **Provides all-year-round ventilation.**
- **Creates a healthier living atmosphere.**

The Combi ventilates the home from within, thereby eliminating the need to open windows.

Quietly pushing fresh filtered air into the dwelling creates a slight positive pressure, reversing the normal airflow. Instead of unfiltered air coming through the natural ingress and gaps around the doors and windows, air is now forced out of the house taking with it condensation forming moisture and the smell of cooking and smoking fumes, being replaced with cleaner fresher air!
